the topics treated in this book are essentially those that a graduate student of physics or electrical engineering should be familiar with in classical electromagnetism each topic is analyzed in detail and each new concept is explained with examples the text is self contained and oriented toward the student it is concise and yet very detailed in mathematical calculations the equations are explicitly derived which is of great help to students and allows them to concentrate more on the physics concepts rather than spending too much time on mathematical derivations the introduction of the theory of special relativity is always a challenge in teaching electromagnetism and this topic is considered with particular care a large number of exercises are included

this instructor's solutions guide accompanies our introductory graduate electrodynamics textbook macroscopic electrodynamics we emphasize that this is a guide and not a step by step exposition for the 391 problems furnished in the text helpful indications of starting points and methods are given as well as enough intermediate steps and occasional final results that a knowledgeable instructor can readily fill in the gaps this approach is designed to provide the instructor with a powerful and time saving teaching aid for introducing students to this beautiful and wide ranging subject this access is given only to instructors who are adopting the textbook for their classes to gain access to this title please fill in the adoption form and we will get back to you soon request inspection copy

an engaging writing style and a strong focus on the physics make this graduate level textbook a must have for electromagnetism students

instructor's solutions manual to accompany modern problems in classical electrodynamics is a supplement to brau's main text it contains solutions to the problems in the textbook and it is available free of charge to adopting professors

this book presents a unified view of the response of materials as a result of femtosecond laser excitation introducing a general theory that captures both ultrashort time non thermal and long time thermal phenomena it includes a novel method for performing ultra large scale molecular dynamics simulations extending into experimental and technological spatial dimensions with ab initio precision for this it introduces a new class of interatomic potentials constructed from ab initio data with the help of a self learning algorithm and verified by direct comparison with experiments in two different materials the semiconductor silicon and the semimetal antimony in addition to a detailed description of the new concepts introduced as well as giving a timely review of ultrafast phenomena the book provides a rigorous introduction to the field of laser matter interaction and ab initio description of solids delivering a complete and self contained examination of the topic from the very first principles it explains step by step from the basic physical principles the underlying concepts in quantum mechanics solid state physics thermodynamics statistical mechanics and electrodynamics introducing all necessary mathematical theorems as well as their proofs a collection of appendices provide the reader with an appropriate review of many fundamental mathematical concepts as well as important analytical and numerical parameters used in the simulations

the book examines the emerging approach of using qualitative methods such as interviews and field observations in the philosophy of science qualitative methods are gaining popularity among philosophers of science as more and more scholars are resorting to empirical work in their study of scientific practices at the same time the results produced through empirical work are quite different from those gained through the kind of introspective conceptual analysis more typical of philosophy this volume explores the benefits and challenges of an empirical philosophy of science and addresses questions such as what do philosophers gain from empirical work how can empirical research help to develop philosophical concepts how do we integrate philosophical frameworks and empirical research what constraints do we accept when choosing an empirical approach what constraints does a pronounced theoretical focus impose on empirical work nine experts discuss their thoughts and empirical results in the chapters of this book with the aim of providing readers with an answer to these questions

this newly corrected highly acclaimed text offers intermediate level juniors and first year graduate students of physics a rigorous treatment of classical electromagnetics the authors present a very accessible macroscopic view of classical electromagnetics that emphasizes integrating electromagnetic theory with physical optics the survey follows the historical development of physics culminating in the use of four vector relativity to fully integrate electricity with magnetism starting with a brief review of static electricity and magnetism the treatment advances to examinations of multipole fields the equations of laplace and poisson dynamic electromagnetism electromagnetic waves reflection and refraction and waveguides subsequent chapters explore retarded potentials and fields and radiation by charged particles antennas classical electron theory interference and coherence scalar diffraction theory and the fraunhofer limit fresnel diffraction and the transition to geometrical optics and relativistic electrodynamics a basic knowledge of vector calculus and fourier analysis is assumed and several helpful appendices supplement the text an extensive solutions manual is also available
